DESCRIPTORS: *Numerical methods and procedures,
Analytic geometry, *Circular orbit trajectories,
*Orbital trajectories, *Asteroids, Celestial mechanics.

A method is proposed for determining the radius of the
circular orbit which is based on the replacement of the
condition of the circular orbit $v_2 - v_1 = ka^{-3/2}$
($t_2 - t_1$) by the approximate equality $\gamma = ka^{-3/2}$
($t_2 - t_1$), where γ is the known angle between the
geocentric directions. The value of the radius found
from this condition is either a good first approximation,
or (in the majority of cases) its final value. (Author)
